

RMF Redux

Overview

ProTech's RMF REDUX analyzes Workload Manager data to finally provide a view of system behavior that truly reflects the policies implemented.

While many products focus on interval reporting and real-time analysis, they all lack the ability to indicate how well a policy is actually performing.

RMF Redux helps you to answer questions like:

- "Is this service class a good candidate for velocity management?"
- "This class exceeds its definition most of the time. Is that good or bad?"

ProTech can run your data through RMF Redux to show how your reports look

Features

- Evaluates SMF type 70 and 72 records based on the number of recorded samples to provide a global view of how work is performing within its respective service class.
- Easy and fast install

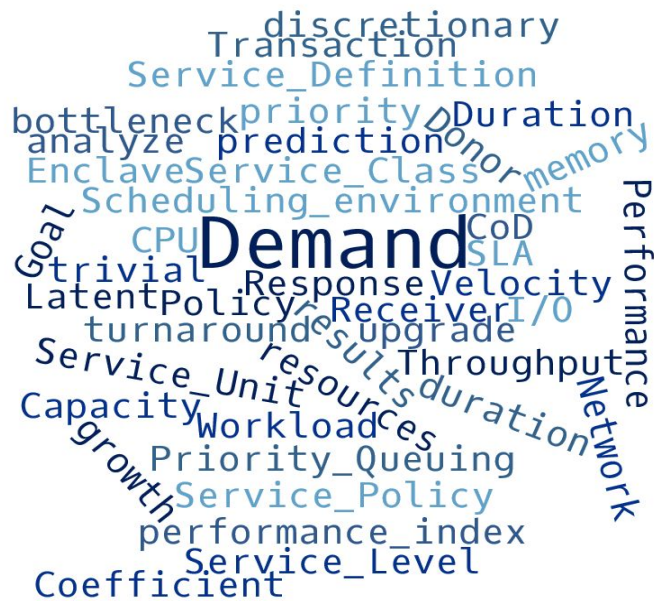

One client was looking at RMF REDUX reports 20 minutes after beginning the software installation!

Benefits

- Monitor effectiveness of your performance tuning
- Eliminates the need to review voluminous amounts of interval data and spending time with a calculator to arrive at conclusions

Requirements

- MVS: Any IBM supported release
